The clay soil properties. The colour of the clay soil is dark (black). The size of its particles is small. It is fertile. It has highly compacted (hard). It is poorly aerated soil that has a high absorption of the water. It has the lowest drainage of the water. The soil layers and the

smaller family members of soil group, Even small amounts of fines can have significant effects on the engineering properties of soils. If as little as 10 percent of the particles in sand and gravel are smaller than the No.200 sieve size, the soil can be virtually impervious, especially when the coarse grains are well graded.

affected by four main factors: the predominant size of the mineral particles, the type of mineral particles, the grain size distribution, and the relative quantities of mineral, water and air present in the soil matrix. Fine particles (fines) are defined as particles less than 0.075 mm in diameter.
